# Survey on Factors Contributing to Healthy Life Style among Adolescence (10-19yrs) 

Department of Nutrition<br>Medical Research Institute<br>In collaboration with<br>Mahidol University, Bangkok<br>And<br>WHO, SEARO

## Chapter 1

## Introduction

Adolescence is a period of sexual maturity that transforms a child into a biologically mature adult capable of sexual reproduction. World Health Organization (WHO) described as the period of sexual development from the initial appearance of secondary sex characteristics to sexual maturity, psychological development from child to adult identification, and socio-economic development from dependence to relative independence (WHO, 1975). Adolescence starts with a period of very rapid physical growth accompanied by the gradual development of reproductive organs, secondary sex characteristics and menarche in girls. Boys' adolescence is generally longer than girls.

Rapid changes in diets and lifestyles resulting from industrialization, urbanization, economic development and market globalization have accelerated during the last decade. This is having a significant impact on the health and nutritional status of populations, in particular in developing countries and countries in transition. While such changes have resulted in improved standards of living and greater access to services, there have also been significant negative consequences in terms of inappropriate dietary patterns and decreased physical activities, along with increased tobacco use, and a corresponding increase in diet-related chronic diseases, not only among the rich but also among the poor.
"Diseases of modernity", the Non Communicable Diseases namely, Cancer, Diabetes, Heart Diseases, Stress related mental illnesses, etc. are in increasing number: with the increasing life expectancies and economic development of the country. These diseases have risen much more rapidly than, can be accounted for, by the demographic shift and follow a strong parallel trend with the agro-industrial production of wealth. Changes in dietary and life style patterns are increasingly significant causes for these diseases leading disability and premature deaths in developing countries and newly developed countries.

Non communicable diseases are largely preventable diseases. More basic research on these is needed on some aspects relative to the mechanisms that link diet and life styles to health.

## Justification

Adolescents are tomorrow's adults and $85 \%$ of them are living in developing countries. And they have been given little health and nutrition attention except for reproductive health concerns.

Obesity among young people is a growing problem in South East Asian countries, may be due to eating patterns and their life styles. Common likings for fast foods and repeated access to same commercial outlets, among school adolescents in urban areas are a contributory factor too.

Adolescents undergo dramatic physical, cognitive, social, and emotional changes in a relatively short period of time. These changes affect their eating practices and health. The rapid increase in growth and development results in increased demand for food and energy and nutrients. The consumption of food to match this demand is impacted by numerous psychosocial factors including newly acquired feelings of independence, peer acceptance, search for self identity, need for sociability and enjoyment, busy life style, concern for appearance, and availability of foods to match their economic status. Their health can be greatly compromised if these needs conflict.

Deficiencies or poor diets are associated with poverty; or as a result of unhealthy eating behaviors as seen in every society of any country. In a given culture adolescents are not a homogeneous group, with wide variation in development, maturity and life style. Therefore their problems are malnutrition, micro nutritional deficiencies and nutrition related chronic diseases.

## Objectives of the Survey

## General

To obtain evidence on adolescent diet and lifestyle for development of programme interventions

Specific objectives:

1. To obtain baseline information on adolescent's dietary habits and lifestyle practices on hygiene and exercise, use of alcohol and tobacco among adolescents.
2. To determine how these parameters vary according to their Gender, Sector, Age group, Grade in school.
3. To identify determinants affecting adolescent dietary habits and lifestyle behaviour - the genuine problems among the adolescents.
4. Recommendations to minimize adolescent problems by intervening as early as possible and providing them a secure healthy life style aiming for a healthy adult society.

## Organization of the Report

## Chapter 2

## Methodology

Medical Research Institute in collaboration with Institute of Nutrition, Mahidol University, Thailand was primarily responsible for designing, planning and implementing the survey while World Health Organization (SEARO) provided the required funding.

## Survey Organization

### 2.1 Study Design

A descriptive cross sectional study design was employed on a representative sample at national level.
representative of the schools selected from four provinces (7 districts).
Focus group discussion (FGD) was conducted among sub sample of children to obtain in-depth information on concepts, perception and ideas of the group.

### 2.2 Study Population

School children aged 10-19 years from both gender groups who are studying in secondary schools were included.

### 2.3 Study location and sampling

Sample size for the survey was determined using the previous study results of deviation of fruit and vegetable consumption among school adolescents. Therefore, the size of the sample required to interview was calculated as 350 per strata with $95 \%$ confidence interval. The total sample size for two areas was 700 .

Lists of eligible schools with students aged 10-19 years taken from the data base of department of education served as the basic sampling frame. Stratified sampling technique followed in selecting the required number of study subjects by applying the following sampling methods.

Stratified cluster sampling technique was adopted to achieve the sample of 700 children from ages 10 years to 19 years. The best stratification to
determine critical risk behaviours among adolescents was identified as the location of the school, whether it is in urban sector or rural sector in Sri Lanka. Hence, stratification was done at sector level and probability proportionate to the size (PPS) sampling technique (total students of 10-19 years in schools) was considered to select five schools in each sector.

All selected schools were listed out with the number of students in the grade 6-13 classes by urban and rural strata separately. 350 students from each stratum was selected using probability proportional to the size of the students. Then all grade 6-13 classes were listed out by number of students in the grade and required number of students from each grade was selected using probability proportional to the size of the students in each grade. Students to be interviewed from each grade were selected from the attendance register by using computer generating random number.

### 2.4 Study instruments

A comprehensive structured questionnaire consisting of five critical risk factors of adolescent health behaviour was developed to collect data. The data collected consist of the following:

- General characteristics of school adolescence
- Critical risk factors of adolescent health behaviour that research shows contribute to the leading causes of death and disability among adults and youth.
- Dietary Behaviour
- Hygiene practices
- Exercise or physical Activity
- Experiences and knowledge on Alcohol, Tobacco and Drugs and
- Anthropometry

Questionnaire was pre-tested at a location out side the study sample. Necessary alterations were made following pretest ensuring smooth implementation of the survey.

### 2.5 Training of the interviewers

Nutrition assistants and Public Health Inspectors with experience in conducting field surveys (attached to the MRI), were recruited as field interviewers to collect data in the schools. They were trained to understand all the questions and a manual of instructions was provided to each investigator.

Standardized equipments were used to collect anthropometric measurements and height was measured with a precision of 0.1 cm . Solar powered Seca electronic weighing scales were used to measure weight to the nearest 100 g .

### 2.6 Ethical considerations

Ethical clearance was obtained from the ethical and research committee of the Medical Research Institute.

### 2.7 Data Collection

All questionnaires were checked for completeness and other errors by the supervisors the same day. Interviewers were supervised by Medical Officers of the Nutrition Division of the MRI. Crosschecks and independent re-interviews were carried out by the supervisors.

All selected study subjects were measured by the interviewers and data were recorded immediately after the measurements.

### 2.8 Data entry and analysis

All completed questionnaires were edited and coded manually and data entered using Epi info software. Cleaning of entered data was done by the chief investigator and corrections effected. BMI is computed by dividing weight in kilograms by the square of height in meters. Classification by WHO expert committee on physical growth (WHO, 1995) has been used to identify prevalence of Thinness (underweight), overweight and obesity considering age appropriate cut off levels for BMI values.

Statistical analyses were done by using SPSS statistical package for descriptive statistics and Pearson Chi square test.

## Chapter 3

## Demographic Characteristics of the study population

Adolescence is best viewed in schools in their peer groups. And there life style patterns differ accordingly. This study Selected schools student population represented a cross section of the adolescents in the country.

### 3.1 Distribution of sample

Table

|  |  | Gender |  |  |  | N |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Male |  | Female |  |  |
|  |  | n | \% | n | \% |  |
| School | Urban school | 242 | 68.8\% | 110 | 31.3\% | 352 |
| sector | Rural school | 195 | 54.5\% | 163 | 45.5\% | 358 |
| Total |  | 437 | 61.5\% | 273 | 38.5\% | 710 |

Altogether 710 children were recruited from both sectors (Table ) and whether the school are in an urban area or rural area the majority were males compared to the females. This disparity occurred due to type of the selected schools; some of the selected schools were mixed schools and some were girls or boys schools. However, the female population in the selected sample was more in rural areas while the male population was more in urban areas.

Considering their residential areas of urban or rural, above parameter was applied equally without much variation. (not clear)

Table
Distribution of children by location of the residence and gender

|  |  | n | $\%$ | N | $\%$ |  |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: |
| Location of residence | Urban | 241 | 68.5 | 111 | 31.5 | 352 |
|  | Rural | 196 | 54.7 | 162 | 45.3 | 358 |
|  |  | 437 | 61.5 | 273 | 38.5 | 710 |

### 3.2 Ethnicity and Religion

Distribution of children according to the ethnicity and religion is shown in Table ---. Majority are Sinhalese (83.2\%) and 75\% affiliated to the religion of Buddhisum.

Table
Distribution of children by Ethnicity and Religion

|  |  |  |  |
| :--- | :--- | ---: | ---: |
|  |  |  |  |
| Ethnicity | Sinhalese | 591 | 83.2 |
|  | Tamil | 32 | 4.5 |
|  | Muslim | 81 | 11.4 |
|  | Burgher | 5 | .7 |
|  | Other | 1 | .1 |
| Religion | Buddhism | 532 | 74.9 |
|  | Hindu | 24 | 3.4 |
|  | Islam | 80 | 11.3 |
|  | Catholic/Christians | 74 | 10.4 |
| Total |  | 710 | 100.0 |

### 3.3 Father's Occupation and Mother's Education <br> Table

| Fathers' occupation and Mothers' level of education |  |  |  |
| :---: | :---: | :---: | :---: |
|  |  | N | \% |
| Occupation of Father | Proffessional Technical and related workers | 36 | 5.1 |
|  | Clerical and buisness | 199 | 28.0 |
|  | Service workers/ Agriculture/Labour | 358 | 50.4 |
|  | Not classified/ No job | 48 | 6.8 |
|  | Abroad | 17 | 2.4 |
|  | Father has left mother | 52 | 7.3 |
| Mothers' level of education | No schooling | 32 | 4.5 |
|  | Grade 1-5 | 67 | 9.4 |
|  | Grade 6-11 | 337 | 47.5 |
|  | Grade 12-13 | 159 | 22.4 |
|  | Diploma/Degree/Higher | 9 | 1.3 |
|  | Dont know | 106 | 14.9 |
| Total |  | 710 | 100.0 |

Fathers of these adolescents were mostly manual workers with an average of $50.4 \%$, while $6.8 \%$ had no proper designated job as such. Apart from that $7.3 \%$ of adolescents were looked after by their mothers only, as father has left the family.

Around $22 \%$ of mothers educated up to grade $12-13$ and majority (56.9\%) have educated up to secondary schools (grade 5-11). Only a few (4.5\%) mothers have not to school. Although 4.5\% of mothers have not gone to school, they had good faith of sending their children to school. It is sad to say that $56.9 \%$ of mothers of adolescents have left school before they reach grade 11 in the school. Out of that $16.5 \%$ have left school at grade 5 or even before that. (Children in Sri Lanka are legally required to remain in school until the age of 14 years.) Mothers' education status was not known by $14.9 \%$ of the children.

### 3.4 Age group and Gender

Table (Percentage should be other way)

| Distribution of children by age and gender |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Gender |  | N |
|  |  | Male | Female |  |
| Age group | 10 yrs | 64.4\% | 35.6\% | 87 |
|  | 11 yrs | 66.3\% | 33.7\% | 89 |
|  | 12 yrs | 69.1\% | 30.9\% | 94 |
|  | 13 yrs | 69.8\% | 30.2\% | 96 |
|  | 14 yrs | 59.8\% | 40.2\% | 97 |
|  | 15 yrs | 61.3\% | 38.7\% | 106 |
|  | 16 yrs | 66.7\% | 33.3\% | 15 |
|  | 17 yrs | 47.4\% | 52.6\% | 57 |
|  | >18 yrs | 43.5\% | 56.5\% | 69 |
| Total |  | 61.5\% | 38.5\% | 710 |

Table ---shows the age distribution of the sample in relation to the gender. The sample was equally distributed among all ages except in 15 and 16 years. The children were selected from particular classes not according to the age which may overlap with this age group.
Male to Female ratio of the selected sample was almost 2:1. Except the age group of 17 and above all the other categories were dominated by the Male population. Probably male adolescents may have left schools after the age of 16 years.
? (The reason for $\mathrm{N}=15$ at the age group of 16 compared to $\mathrm{N}=106$ in 15yrs. )

## Chapter 4

## Nutritional Status of Children

Suggested tables

1. Mean height, weight, BMI in relation to age, gender and sector
2. Prevalence of stunting in relation to age, gender and sector with $Z$ score values
3. Prevalence of thinness and overweight in relation to age, gender and sector with $Z$ score values

### 4.1 Mean heights of children by age and gender (Table will be more appropriate)

Figure:

In early adolescence (11 years) evidence of growth spurt was seen; mean height for female children was $141.1+\_5.45 \mathrm{~cm}$ compared to $138.1+-7.7 \mathrm{~cm}$ for male children and after the age of 14 years boys had lower mean height compared to girls.

Figure:

Table
Mean weight, height and BMI of the sample by age, gender and sector

|  |  | Height in cm |  |  | Weight in kg |  |  | Body Mass Index |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Mean | Median | SD | Mean | Median | SD | Mean | Median | SD |
| Age | 10 yrs | 132.66 | 132.20 | 6.94 | 26.69 | 25.90 | 6.72 | 15.0 | 14.8 | 2.3 |
| group | 11 yrs | 139.26 | 139.60 | 7.14 | 30.25 | 28.90 | 6.79 | 15.5 | 15.1 | 2.4 |
|  | 12 yrs | 141.87 | 142.00 | 7.24 | 32.23 | 31.35 | 5.92 | 16.0 | 15.3 | 2.6 |
|  | 13 yrs | 150.85 | 150.50 | 7.65 | 37.93 | 36.60 | 7.75 | 16.5 | 16.3 | 2.3 |
|  | 14 yrs | 154.24 | 153.30 | 7.98 | 40.32 | 39.55 | 7.98 | 16.8 | 16.6 | 2.3 |
|  | 15 yrs | 159.78 | 160.85 | 8.07 | 46.39 | 45.25 | 8.50 | 18.1 | 17.8 | 2.6 |
|  | 16 yrs | 160.04 | 157.50 | 8.19 | 47.59 | 43.40 | 16.05 | 18.3 | 16.9 | 4.3 |
|  | 17 yrs | 160.90 | 160.50 | 7.95 | 48.55 | 47.60 | 9.26 | 18.7 | 18.0 | 3.0 |
|  | 18 yrs | 160.73 | 159.00 | 9.12 | 47.72 | 46.60 | 7.11 | 18.5 | 18.4 | 2.2 |
| Total |  | 149.74 | 149.90 | 12.62 | 38.44 | 38.15 | 10.90 | 16.8 | 16.3 | 2.8 |

And even more deviation was seen in mean weight at the age group 16 yrs of the female population.

Figure

Table
Mean and median Height, weight and BMI by age and sector

|  |  | Height in cm |  |  | Weight in kg |  |  | Body Mass Index |  |  |

|  | 12 yrs | 141.67 | 142.05 | 8.21 | 32.22 | 31.10 | 5.98 | 16.1 | 15.2 | 3.1 |
|  | 13 yrs | 150.76 | 151.30 | 7.10 | 38.09 | 36.40 | 8.63 | 16.6 | 16.1 | 2.5 |
|  | 14 yrs | 153.79 | 152.60 | 8.15 | 38.71 | 38.45 | 6.86 | 16.3 | 16.2 | 1.9 |
|  | 15 yrs | 157.54 | 158.55 | 7.50 | 45.23 | 44.45 | 9.06 | 18.1 | 17.5 | 2.9 |
|  | 16 yrs | 160.18 | 156.35 | 10.03 | 52.82 | 46.40 | 22.47 | 20.1 | 18.2 | 5.9 |
|  | 17 yrs | 156.60 | 155.50 | 6.56 | 47.70 | 45.70 | 11.33 | 19.3 | 18.1 | 3.8 |
|  | 18 yrs | 160.75 | 158.60 | 8.89 | 47.41 | 46.70 | 5.13 | 18.4 | 17.9 | 2.1 |
| Total |  | 148.75 | 149.55 | 11.94 | 37.82 | 37.10 | 10.75 | 16.8 | 16.2 | 2.9 |

Figure:

The standard deviation of mean height is higher in 18 year age group in both populations. There was wide variation of weight and heights at the age group of 16 yrs in rural population. This variation of weight has been reduced to 11.3 in the mean weight of 17 yrs in rural settings.

Mean BMI was highest in $18 y r s$ among urban school adolescents while rural adolescents showed highest BMI at the age of 16 yrs .

Prevalence of Thinness, overweight and obesity in adolescents

Considering all age groups ( $\mathrm{N}=710$ ) in both rural and urban there is a total of $2.5 \%$ adolescents who are overweight and obese while only $66.6 \%$ were within normal BMI range. Prevalence of thinness among these children was $30.8 \%$. (Obesity is defined by an indirect measure of body fat, the body Mass Index (weight in $\mathrm{kg} /$ Height in metre ${ }^{2}$ ).)

Again 3.2\% of Males and 1.5\% Females were overweight and obese giving an impression that more females are within normal BMI range than males. This has been favored by the less thinness of females compared to males according to BMI.

## Figure:

In this survey more overweight/obesity is seen in rural sector than urban ( $2.8 \%$ in rural to $2.3 \%$ respectively)
This resemblance has not changed even with considering the thinness. (32.1\% to $29.5 \%$ respectively)
Prevalence of thinness, overweight in relation to age, gender and sector

Prevalence of thinness, overweight and obesity by age, gender and sector

### 4.2 How has the Nutritional status of the adolescent been affected

 by,Nutritional status by food habits

|  |  | Body Mass Index group |  |  |  | N |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Thinness | Normal | Overweight | Obese |  |
|  |  | \% | \% | $\begin{aligned} & \% \\ & \hline 1.4 \% \\ & 1.7 \% \end{aligned}$ | \% |  |
| Hunger due to not enough food at home | Never | 29.7\% | 67.7\% |  | 1.1\% | 629 |
|  | Rarely (1-5 days) | 43.1\% | 55.2\% | $1.7 \%$ |  | 58 |
|  | Some times (6-12 days) | 25.0\% | 75.0\% |  |  | 12 |
|  | Most of the time (13-29 days) | 25.0\% | 75.0\% |  |  | 4 |
|  | Always (30 days) | 42.9\% | 42.9\% | 14.3\% |  | 7 |
| Number of Breakfasts taken | Never | 33.3\% | 66.7\% |  |  | 51 |
|  | Rarely (1-5 days) | 22.5\% | 77.5\% |  |  | 40 |
|  | Some time (5-8 days) | 30.4\% | 68.4\% | 1.3\% |  | 79 |
|  | Most of the time (9-19 days) | 36.6\% | 61.2\% | 1.5\% | .7\% | 134 |
|  | Always (>20) | 29.6\% | 67.0\% | 2.0\% | 1.5\% | 406 |
| Breakfast at school | Never | 28.1\% | 69.5\% | 1.6\% | .8\% | 367 |
|  | Rarely (1-4 days) | 29.1\% | 70.9\% |  |  | 79 |
|  | Some times (5-8 days) | 37.9\% | 62.1\% |  |  | 58 |
|  | Most of the times (9-19 days) | 28.7\% | 67.8\% | 2.3\% | 1.1\% | 87 |
|  | Always (>20 days) | 38.7\% | 56.3\% | 2.5\% | 2.5\% | 119 |

There were 7 children who responded as there was no food to eat at home and adolescents were in hunger. But 629 children were had no problems in finding food to combat their hunger.

Reasons for missing breakfast

|  |  | School sector |  |  |
| :--- | :--- | ---: | ---: | ---: |
|  |  | Urban school | Rural school | Total |
| Main reasons | Dont have time for breakfast | $17.3 \%$ | $19.6 \%$ | $18.5 \%$ |
| for missing | Cant eat early in the morning | $15.3 \%$ | $17.9 \%$ | $16.6 \%$ |
| breakfast | There is not always food in my home | $2.6 \%$ | $2.0 \%$ | $2.3 \%$ |
|  | Some other reason | $4.0 \%$ | $3.1 \%$ | $3.5 \%$ |
|  | No answer | $60.8 \%$ | $57.5 \%$ | $59.2 \%$ |

Although 59.2\% of Adolescents had no answer to reason out for missing their break fast but only $2.3 \%$ were frank to say that there was no food to eat in the morning at home. $18.5 \%$ were had no time to eat breakfast and $16.6 \%$ said that they can't eat early in the morning. This has been flagged more in rural setting.
?( Urban >Rural - said no food at home -> 2.6\%)

Perception about the body weight

|  |  | School sector |  |  |
| :--- | :--- | ---: | ---: | ---: |
|  |  | Urban school | Rural school |  |
| Perception | Very underweight | $.9 \%$ | $1.1 \%$ | $1.0 \%$ |
| about body | Slightly underweight | $20.2 \%$ | $22.3 \%$ | $21.3 \%$ |
| weight | About the right weight | $50.6 \%$ | $49.4 \%$ | $50.0 \%$ |
|  | Slightly overweight | $9.1 \%$ | $13.1 \%$ | $11.1 \%$ |
|  | Very overweight | $.9 \%$ | $.3 \%$ | $.6 \%$ |
|  | No idea | $18.5 \%$ | $13.7 \%$ | $16.1 \%$ |
|  | Col \% | $100.0 \%$ | $100.0 \%$ | $100.0 \%$ |

A total of $16.1 \%$ had no idea about there weight whether it is adequate or not, rest of the others were conscious about their weight and $50 \%$ of the sample knew they are within their expected weight limits.

## Action taken for weight control

|  | School sector |  |  |
| :--- | ---: | ---: | ---: |
|  | Urban school | Rural school |  |
| Lose weight | $7.1 \%$ | $7.8 \%$ | $7.5 \%$ |
| Gain weight | $9.7 \%$ | $12.8 \%$ | $11.3 \%$ |
| Maintain the same weight | $10.5 \%$ | $10.3 \%$ | $10.4 \%$ |
| Not trying to do anything | $72.2 \%$ | $68.7 \%$ | $70.4 \%$ |
| No answer | $.6 \%$ | $.3 \%$ | $.4 \%$ |
|  | $100.0 \%$ | $100.0 \%$ | $100.0 \%$ |

To control their weight $70.4 \%$ had not tried any thing, but $29.2 \%$ were taking some plan to control their weight. This has been seen more or less in both urban and rural settings with only a slight difference.

Action taken for weight control

|  |  | History of taking drugs to control weight |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Yes | No | No answer |
| Age group | 10 yrs |  | 98.9\% | 1.1\% |
|  | 11 yrs | 2.2\% | 97.8\% |  |

|  | 13 yrs | 1.1\% | 98.9\% |  |
|  | 14 yrs | 2.0\% | 98.0\% |  |
|  | 15 yrs | . $9 \%$ | 99.1\% |  |
|  | 16 yrs |  | 100.0\% |  |
|  | 17 yrs | 3.5\% | 96.5\% |  |
|  | 18 yrs |  | 100.0\% |  |
| Total |  | 1.3\% | 98.6\% | .1\% |
| School sector | Urban school | 1.4\% | 98.3\% | . $3 \%$ |
| Gender | Rural school | 1.1\% | 98.9\% |  |
|  | Male | 1.4\% | 98.4\% | .2\% |
|  | Female | 1.1\% | 98.9\% |  |

| Practice starvation for weight control |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Starvation as a weight control method |  |  |
|  |  | Yes | No | No answer |
| Age group | 10 yrs |  | 98.9\% | 1.1\% |
|  | 11 yrs | 1.1\% | 98.9\% |  |
|  | 12 yrs | 1.1\% | 98.9\% |  |
|  | 13 yrs | 2.1\% | 97.9\% |  |
|  | 14 yrs | 1.0\% | 99.0\% |  |
|  | 15 yrs |  | 100.0\% |  |
|  | 16 yrs |  | 100.0\% |  |
|  | 17 yrs | 1.8\% | 96.5\% | 1.8\% |
|  | 18 yrs |  | 100.0\% |  |
| Total |  | . $8 \%$ | 98.9\% | . $3 \%$ |
| School sector | Urban school | . $6 \%$ | 98.9\% | .6\% |
|  | Rural school | 1.1\% | 98.9\% |  |
| Gender | Male | . $5 \%$ | 99.1\% | . $5 \%$ |
|  | Female | 1.5\% | 98.5\% |  |

Some were using drugs to control their weight without any sort of medical advice. This can be seen mostly at the age group of 17 yrs , urban schools, and among male adolescents.

Starvation is also a method used by adolescents to control their weight seen at the age group of 17 yrs ( $1.8 \%$ ), although same percentage ( $1.8 \%$ ) had no answer regarding starvation as a weight control measure. This is observed more in rural schools and among females.

Food habits and consumption pattern
